

Challenges Faced

- MongoDB Shell (mongosh) was not recognized in PowerShell, so MongoDB commands were initially unavailable from the terminal.
- MongoDB Compass was used as an alternative to connect to the local MongoDB server and access the MongoDB Shell.
- While performing CRUD operations, care was required to use the correct query syntax and field names.
- Understanding and implementing the aggregation pipeline stages such as \$match, \$group, and \$sort required some practice.
- During the supplementary task, the mongoimport command was not recognized because MongoDB Database Tools were not available in the system PATH.
- The JSON dataset was therefore handled through MongoDB Compass instead of the command-line mongoimport utility.
